
First Project Status Update

Team 4 · WeLoveDS

1. Introduction of Team Members

Name	Major	Home Uni	Skills	Recent Interests	Roles
Wenhui Jin	TEMEP	Seoul National University	Python, SQL Korean, Mandarin, Japanese, English	AI impact on occupation and human skill, NLP	Team coordination, prompt improvement
Ruibo Duan	Ph.D. in Computer Science	Seoul National University	Python, algorithm design, optimization, machine learning Korean, Mandarin, English	Optimization, LLM	prompt improvement
Donghyun Ken Kim	TEMEP	Seoul National University	Python, SQL English (Native), Korean (Highly Proficient)	XAI, ML/DL, Automation with AI, OpenClaw	prompt improvement, presentation
Jia Song	Computer Science	Université de Montréal (exchange)	Python, n8n English, French, Chinese	LLM, NLP, data science	prompt improvement

2. Status update - First Trial

What we try in the “student solver.py”:
A three-layer pipeline plus a fallback path:

Prompt layer — `STUDENT_PLANNER_INSTRUCTIONS`: 6 numbered rules + faithfulness clause + `MEMORY_REPORT_GUIDANCE`.

Planner layer — `_run_planner`: low-reasoning gpt-5.4-nano, 14 tool rounds, strict JSON schema, `single_memory` role.

Post-processing layer — `_build_final`: five deterministic enrichments (`derive_retired_from_state`, `all_stale_docs`, `derive_spoken_rule_hits_from_state`, `derive_required_docs_from_state`, `derive_rejected_from_state`) inject state-grounded facts into `memory_report` to align with evaluator scoring.

Fallback — `_fallback_result`: on `RuntimeError`, returns a minimal submission that still passes through Layer 3, preserving memory-metric credit.

Metric	Score	Weight
Feasibility	0.849	40%
Preference	0.850	30%
Adaptation	0.901	20%
Efficiency	0.420	10%
Student total	0.8170	
Cost / run	\$0.071	

Final numbers (verify_v1, current best)

Variance band across 3 runs: **±0.02**. Ceiling: **~0.80**.

Problems

Question for TA

- What kind of materials should we submit for the final project? (Github link+any documents?)

Question for Professor

- ask anything

Next step

- Improvement on the efficiency by updating the prompt
 - Change the xxxxxxxxxxxxxx
-
- Any comments will be highly appreciated!

You are free to design

- Single agent vs. MAS
- Number of agents and role split
- Prompt design
- Memory write / retrieve / retire policy
- Rerankers, verifiers, and wrapper tools
- Search strategy
- Model parameters

Thank you!
